Exercise Program

Create a form similar to the shown below. There are four buttons and five labels.

- Set the buttons with one of the background images (Jellyfish, Koala, Penguin and Tulip).

- When any of the buttons is clicked, the click count for that button and total click count should be increased by 1. Then calculate the percentage of each button clicked. For example, percentage of Jellyfish = jellyfishCount/totalCount.

- Update all the five labels with the new values. Hint: use class level variables. You will need five variables.

- Format the percentage value while showing in the label.
  Hint: use ToString("p")
